

AMENDMENTS TO THE CLAIMS

In the Claims:

1. (Previously Presented) A printed circuit board chassis device comprising:
 - a structural component; and
 - at least two circuit board securing devices coupled to the structural component, the securing devices comprising:
 - a base section attached to a respective wall, the base section including a groove formed by a first and second wall;
 - a securing member that is received by the base section;
 - a first component configured to move the securing member at a first end longitudinally within the groove of the base section;
 - a second component configured to keep a second end of the securing member within the groove of the base section; and
 - one or more force-producing devices for moving the securing member closer to the first wall of the base section as the first component is adjusted, the one or more force-producing devices being coupled to the base section.
2. (Original) The device of Claim 1, wherein the first component comprises a screw received through a slot in the base section and into a threaded cavity of the securing member.
3. (Original) The device of Claim 1, wherein the second component comprises a set screw received through a threaded cavity of the base section and a slot of the securing member.
4. (Original) The device of Claim 1, wherein the securing member comprises one or more lateral support devices.
5. (Original) The device of Claim 1, wherein the force-producing devices comprise a plurality of ramps located on the base section and the securing member.
6. (Previously Presented) The device of Claim 1, wherein the securing member is a monolithic member.
7. (Currently Amended) A circuit board securing device comprising:
 - a base section including a groove formed by a first and second wall;
 - a securing member that is received by the base section;

a first component configured to move the securing member longitudinally within the groove of the base section;
a second component configured to keep a second end of the securing member within the groove of the base section; and
one or more force-producing devices for moving the securing member closer to the first wall of the base section as the first component is adjusted, the one or more force-producing devices being coupled to the base section.

8. (Original) The device of Claim 7, wherein the first component comprises a screw received through a slot in the base section and into a threaded cavity of the securing member.

9. (Original) The device of Claim 7, wherein the second component comprises a set screw received through a threaded cavity of the base section and a slot of the securing member.

10. (Original) The device of Claim 7, wherein the securing member comprises one or more lateral support devices.

11. (Original) The device of Claim 7, wherein the force-producing devices comprise a plurality of ramps located on the base section and the securing member.

12. (Previously Presented) The device of Claim 7, wherein the securing member is a monolithic member.
